

## Hydraulic Boom Lift Attachment

Hydraulic Boom Lift Attachments - Boom lifts are equipment that has a platform which can be lowered or raised to many heights, thus making this piece of equipment an important requirement in a wide variety of professions. Available in several particular varieties such as aerial platform lifts, scissor platform lifts, and knuckle boom lifts, each type functions very specifically.

The regular aerial lift adaptation is regularly used at snowboarding lodges to carry people who are not at ease using the skiing lift. Working in a manner analogous to that of an elevator, skiers are transported up the mountain gradually, stopping at stations along the way until they access the summit. Aerial platform lifts are also used in construction, transporting workers securely up and down the sides of multi-level building sites.

Scissor jacks are also in the boom lift group. They are used regularly by utility companies as an idyllic system to allow employees to finish upkeep and repair on wires and cables that are attached to poles. Telephone, cable and power corporations have relied on the effectiveness of this style of boom jack for years.

The knuckle boom jack is built for use within areas of irregular ground and where the need to change course could be necessary. This style of boom lift has the capability to fit in tight spots where a scissor lift cannot fit. Working amid numerous machines in a production plant or in near proximity sandwiched between two walls, the knuckle boom also features a standard platform outfitted with rails for security and employee safety.

Based on the work requirements and the nature of work to be completed will establish the appropriate type of boom jack to select. Luckily, there is a version suited for practically any purpose.
